When used correctly and in combination with other methods, it's a valid way of recovering a lost password and maybe even get your data back. But let's take a quick look at some of the tools that make this tool possible. Causes of Password Leaks The variety of software and hardware (bad) solutions to protect your data and passwords range from simple password protectors like software or hardware based passwords to complex multi-layered security systems with many different layers of authentication.

It's important to know why your passwords may have been compromised, in order to help you in the recovery process.

Accidental or malicious Accidental losses are usually due to a careless user, who either didn't know how to properly store and protect their data or simply didn't know that protecting their data was important. It's important to protect the data because some of them have sensitive content such as financial information. Malicious losses are usually the result of someone trying to get access to your data by trying to guess your password, by using password recovery tools or by simply stealing the password. Logs or traceable Sometimes, a password is simply not secret enough or simply doesn't have enough characters. Some web sites do not force users to use strong passwords and they store the usernames and passwords in logs or logs may be used to trace the history of the username and/or password. History of users As mentioned above, if someone knows that you're using the same password on multiple websites, it's easy to have guessed one of the websites passwords. If you have used the same password across many websites, it's not likely that any of them would be compromised, but it's possible that any or all of the websites have been compromised because the perpetrator may have stolen your password from somewhere else. Lack of standards In many cases, sites still use the old method of storing passwords in their website's database. When this is the case, the chances of having the same passwords are high because the site has no control over the client or if the site had a program that enforces them to be secure. Poor password selection If you choose passwords that are easily guessable, then it's likely that they're easily guessed as well. This is a big problem on the internet because of the fact that most of the websites today use some sort of online authentication and most of the time, the user simply enters the username and password that was provided in the registration
